Stock Portfolio Tracker

Aim

To develop a simple stock portfolio tracker using Python that calculates the total investment value based on user input and predefined stock price

,Algorithm

1. Start
2. Define stock prices using a dictionary
3. Set total investment = 0
4. Ask user to enter stock name
5. If user enters "done", stop
6. Check if stock exists in dictionary
7. If yes:
    - Ask quantity
    - Calculate investment = price × quantity
    - Add to total
8. Repeat steps until user stops
9. Display total investment
10. Save result in a file
11. End

PROGRAMME CODE

```
# Predefined stock prices
stock_prices = {
    "AAPL": 180,
    "TSLA": 250,
    "GOOG": 2800,
    "MSFT": 320,
    "AMZN": 140
}

total_investment = 0

print(" Stock Portfolio Tracker")

while True:
    stock = input("Enter stock name (or type 'done' to finish): ").upper()

    if stock == "DONE":
        break
```

```
    if stock in stock_prices:
        quantity = int(input("Enter quantity: "))
        investment = stock_prices[stock] * quantity
        total_investment += investment
        print(f"Added {stock} worth {investment}")
    else:
        print("Stock not available")

print("\nTotal Investment Value:", total_investment)

# Optional: Save to file
file = open("portfolio.txt", "w")
file.write("Total Investment: " + str(total_investment))
file.close()

print("Saved to portfolio.txt")
```

INPUT &OUTPUT

main.py

```python
# Predefined stock prices
stock_prices = {
    "AAPL": 180,
    "TSLA": 250,
    "GOOG": 2800,
    "MSFT": 320,
    "AMZN": 140
}

total_investment = 0

print(" Stock Portfolio Tracker")

while True:
    stock = input("Enter stock name (or type 'done' to finish): ").upper()

    if stock == "DONE":
        break

    if stock in stock_prices:
        quantity = int(input("Enter quantity: "))
        investment = stock_prices[stock] * quantity
        total_investment += investment
        print(f"Added {stock} worth {investment}")
    else:
        print("Stock not available")
```

Output

```
 Stock Portfolio Tracker
Enter stock name (or type 'done' to finish): AAPL
Enter quantity: 20
Added AAPL worth 3600
Enter stock name (or type 'done' to finish): AMZN
Enter quantity: 10
Added AMZN worth 1400
Enter stock name (or type 'done' to finish): done

Total Investment Value: 5000

Result

The stock portfolio tracker was successfully implemented using Python. The program accepts user input for stock names and quantities, calculates the total investment using predefined prices, and displays the result. The final output is also saved in a text file.
